LIST OF ERRATA

Routing, Flow, and Capacity Design in Communication and Computer Networks

Michał Pióro & Deepankar Medhi

CHAPTER 3
Pages 85 and 86
The model discussed in Section 3.4 should be adjusted in the following way:
We should consider demand volume \( h_d \) to be in Mbps and accordingly change the capacity constraint to
\[
\sum_d h_d \sum_p \delta_{edp} u_{dp} \leq My_e, \quad e = 1, 2, \ldots, E,
\]
where \( M \) is the capacity unit of an ATM link, say \( M = 155 \) Mbps. Thus, \( y_e \) means the number of such module units required on link \( e \). Now, let \( \xi_e \) be the unit cost of a one 155 Mbps module \( M \) on link \( e \). Then, model (3.3.2) would change to:
\[
\begin{align*}
\text{minimize} & \quad \sum_e \xi_e y_e \\
\text{subject to} & \quad \sum_p u_{dp} = 1, \quad d = 1, 2, \ldots, D \\
& \quad \sum_d h_d \sum_p \delta_{edp} u_{dp} \leq My_e, \quad e = 1, 2, \ldots, E \\
& \quad u_{dp} \text{ binary}, \quad y_e \text{ integers}.
\end{align*}
\]

CHAPTER 4
Page 117 formula (4.2.2c) should read:
\[
\sum_p \delta_{edp} x_{dp} \leq h_d / n_d, \quad e = 1, 2, \ldots, E \quad d = 1, 2, \ldots, D.
\]
instead of:
\[
\delta_{edp} x_{dp} \leq h_d / n_d, \quad e = 1, 2, \ldots, E \quad d = 1, 2, \ldots, D \quad p = 1, 2, \ldots, P_d
\]
Page 118 lines 17-18 from the bottom delete the following:
; this constraint is redundant (and can be removed) as it is implied by (4.2.3a)

Page 138 formula (4.3.24a) should read:
\[
\begin{align*}
\text{minimize} & \quad F = \sum_e \xi_e \sum_k (a_{ek} y_{ek} + b_{ek} u_{ek}) \\
\text{instead of:} & \quad \text{minimize } F = \sum_e \sum_k (a_{ek} y_{ek} + b_{ek} u_{ek})
\end{align*}
\]
Page 149 lines 14-16 from the top should read:
Show that the property \( f(z_1) / z_1 \geq f(z_2) / z_2 \) for \( z_1 < z_2 \) holds for non-decreasing concave functions, and that the property \( f(z_1) / z_1 \leq f(z_2) / z_2 \) for \( z_1 < z_2 \) holds for non-decreasing convex functions (in both cases we assume \( f(0) = 0 \)).
instead of:
Show that the property \( f(z_1) / z_2 \geq f(z_2) / z_2 \) for \( z_1 < z_2 \) holds for non-decreasing concave functions, and that the property \( f(z_1) / z_2 \leq f(z_2) / z_2 \) for \( z_1 < z_2 \) holds for non-decreasing convex functions.

\end{align*}
\]
instead of:

\[
\begin{align*}
\text{minimize} & & F = \sum_d \sum_p \left( \sum_e \zeta_{ed} \delta_{edp} \right) u_{dp} h_d \\
\text{subject to} & & \sum_d u_{dp} = 1, \quad d = 1, 2, \ldots, D \\
& & \sum_d \sum_p \delta_{edp} u_{dp} h_d \leq M_e u_e, \quad e = 1, 2, \ldots, E.
\end{align*}
\]

CHAPTER 7

Pages 267, 267, and 277

Problems (7.2.1) and (7.4.2) need the following clarification:

In the case of integral positive weights it is always the case that if two paths have different lengths, then these lengths differ by at least 1. In the case of continuous weights \( w_e \geq 1 \), for any feasible solution \( w \) we can form another feasible solution \( w' \) of the form \( w' = \alpha w \) such that any two paths \( P_1 \) and \( P_2 \) have the same same length with respect to \( w \) if, and only if, \( P_1 \) and \( P_2 \) have the same length with respect to \( w' \). Moreover, if two paths \( P_1 \) and \( P_2 \) have different lengths for \( w \), then their lengths differ by at least 1 for \( w' \) (we just need to choose a sufficiently large scalar \( \alpha > 1 \)). We use this property in (7.2.1g) and in (7.4.2a).
